INTRODUCTION

Antaira Technologies' SFP-C1-TAA Copper Small Form Pluggable (SFP) transceivers are a high performance, cost effective module compliant with the Gigabit Ethernet and 100BASE-T standards as specified in IEEE 802.3-2002 and IEEE 802.3ab, which supports 1000 Mbps data-rate up to 100 meters over unshielded twisted-pair category 5 cable. The module supports 1000 Mbps full duplex data-links with 5-level Pulse Amplitude Modulation (PAM) signals. All four pairs in the cable are used with a 250Mbps signal rate on each pair. The module provides standard serial ID information compliant with SFP MSA, which can be accessed by the address of A0h via the 2 wire serial CMOS EEPROM protocol. The physical IC can also be accessed via a 2 wire serial bus at address A0h. These SFP transceivers are Trade Agreements Act (TAA) compliant.

Notes:

1. Clock tolerance is +/- 50 ppm
2. By default, the SFP-C1-TAA is a full duplex device in preferred master mode.
3. Automatic crossover detection is enabled. External crossover cable is not required.
4. 1000BASE-T operation requires the host system to have an SGMII interface with no clocks, and the module PHY to be configured.

Notes:

Plug Seq.: Pin engagement sequence during hot plugging.

- TX Fault is an open collector output, which should be pulled up with a 4.7k~10kΩ resistor on the host board to a voltage between 2.0V and Vcc+0.3V. Logic 0 indicates normal operation; logic 1 indicates a laser fault of some kind. In the low state, the output will be pulled to less than 0.8V.
- TX Disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 4.7 K 10 K resistor. Its states are:
 - Low (0 to 0.8V): Transmitter on
 - (>0.8, < 2.0V): Undefined
 - High (2.0 to 3.465V): Transmitter Disabled
 - Open: Transmitter Disabled
- Mod-Def 0,1,2. These are the module definition pins. They should be pulled up with a 4.7K to 10K resistor on the host board. The pull-up voltage shall be VccT or VccR
Mod-Def 0 is grounded by the module to indicate that the module is present

Mod-Def 1 is the clock line of two wire serial interface for serial ID

Mod-Def 2 is the data line of two wire serial interface for serial ID

4. LOS (Loss of Signal) is an open collector/drain output, which should be pulled up with a 4.7K to 10K resistor. Pull up voltage between 2.0V and V_{ccT} , $R+0.3V$. When high, this output indicates the received optical power is below the worst-case receiver sensitivity (as defined by the standard in use). Low indicates normal operation. In the low state, the output will be pulled to $<0.8V$.
5. RD-/+: These are the differential receiver outputs. They are AC coupled 100 differential lines which should be terminated with 100 (differential).
6. TD-/+: These are the differential transmitter inputs. They are AC-coupled, differential lines with 100 differential termination inside the module.
